FILES HANDLING IN PYTHON

File:

A file is an external storage on hard disk from where data can be stored and retrieved.

operations on files:

1.opening a file: to open a file use open() function. it returns an object of file which is used with other functions.

Syntax:

obj=open(filename,mode,buffer)

2.closing a file: once you are finished with the operation on file at the end you need to close the file. it is done by using the close() method

3.write to a file file.write() is use to write a string into the file.

Syntax:

File object.write(String str)

4.reading from a file: read() method is used to read data from the file.

Syntax:

File object.read(value)

Attributes of file:

- **Name:returns the name of the file.**
- **mode: returns the mode in which file is being opened.**
- **closed: returns Boolean value. True, in case if file is closed else false.**

Example:

```
>>> obj=open("python.txt","w")
>>> print(obj.name)
python.txt
>>> print(obj.mode)
w
>>> print(obj.closed)
False
```

```
>>>
```

Modes of file:

mode	Description
r	It opens in reading mode. it is default mode of a file
rb	It opens in reading mode for binary format
r+	Opens a file for reading and writing
rb+	Opens a file for reading and writing in binary format
w	Opens a file in writing mode
wb	Opens a file in writing mode in binary format
w+	Opens a file for reading and writing
wb+	Opens a file for reading and writing in binary format
a	File in appending mode
ab	Appending mode in binary format
a+	Opens file in reading and appending mode
ab+	Opens a file in reading and appending mode in binary format

Example-1:

```
#creating a file and writing some data into the file
obj=open("basic.txt","w")
obj.write("today we are discussing file concepts with examples")
obj.close()

#read the data from the file
obj1=open("basic.txt","r")
s=obj1.read()
print(s)
obj1.close()

#read the data from the file by using specific characters
obj2=open("basic.txt","r")
s1=obj2.read(20)
print(s1)
```

```
obj2.close()
```

Example-2:

```
#copying a data from one file to another file
file1=open("basic.txt","r")
file2=open("output.txt","w")
reader=file1.read()
file2.write(reader)
file1.close()
file2.close()
```
