Python `re` Module – Function Names and Syntax

Import Module

import re

---

1. re.match()

Syntax

re.match(pattern, string)

Matches the **pattern only at the beginning of the string**.

---

2. re.search()

Syntax

re.search(pattern, string)

Searches the **entire string** and returns the **first occurrence**.

---

3. re.findall()

Syntax

re.findall(pattern, string)

Returns **all matches in the string as a list**.

---

5. re.split()

Syntax

re.split(pattern, string, maxsplit=0)

Splits the string based on the **pattern**.

---

6. re.sub()

Syntax

re.sub(pattern, replacement, string, count=0)

Replaces the **matched pattern with another string**.

---

7. re.subn()

Syntax

re.subn(pattern, replacement, string, count=0)

Same as **sub()** but returns **(new_string, number_of_replacements)**.

---

8. re.compile()

Syntax

re.compile(pattern)

Compiles a **regular expression pattern into a regex object**.

Summary

Function	Syntax
match()	re.match(pattern, string)
search()	re.search(pattern, string)
findall()	re.findall(pattern, string)
split()	re.split(pattern, string)
sub()	re.sub(pattern, replacement, string)
subn()	re.subn(pattern, replacement, string)
compile()	re.compile(pattern)
fullmatch()	re.fullmatch(pattern, string)

Flags=re.IGNORECASE
