CLASS :- get request in flask **DATED :- 19/02/2026**

PAGE:- **get attributes from urls**

----------flask----------

```
from flask import Flask, redirect, url_for, render_template, request

a=Flask("__name__")
@a.route("/home")
def home():
   return render_template("home.html",name="satish")

@a.route("/<home>")
def homepage(home):
   if home in ["h","next","first","last","1"]:
       f_name=request.args.get("first")
       l_name=request.args.get("last")
       sur=request.args.get("sur")
       return  render_template("home.html",fr_name=f_name,
                                          ls_name=l_name,sur_name=sur)
#        return f"  name{f_name}  last {l_name}"
   else:
      return "page not found"

if __name__=="__main__":
   a.run(debug=True)
```

----------html----------

***Page**:-HOME.html*

```
<body bgcolor="wheat">
   <center><u><h1 > this is the home page</h1></u></center>
```

```
<p> <font color="green"> this is the first page from the home function  retrived
with </br>
end points of ["h","p1","first","page1","1"]</font></p><br>

<center><h2> <font color="purple"> hello {{fr_name}}{{ls_name}} {{"
"+sur_name}}</font></h2></center>

</body>
```
